ANALYSIS OF DEGRADATION PROCESSES ON SLOVENIAN BRIDGES

dr. Matej Kušar
prof.dr. Jana Šelih

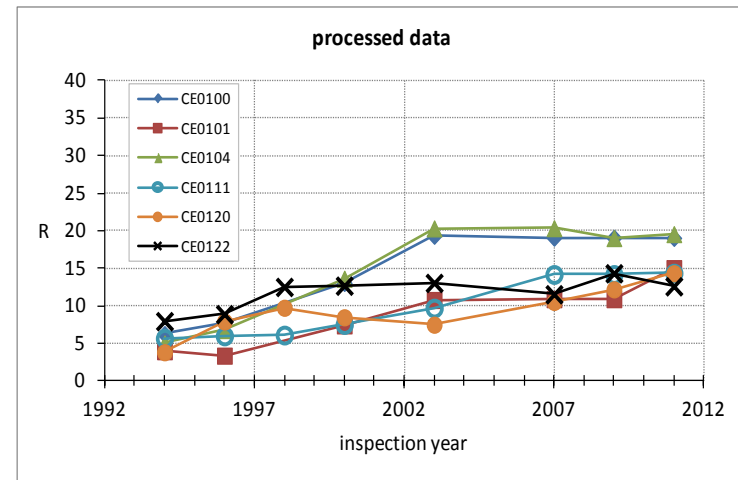

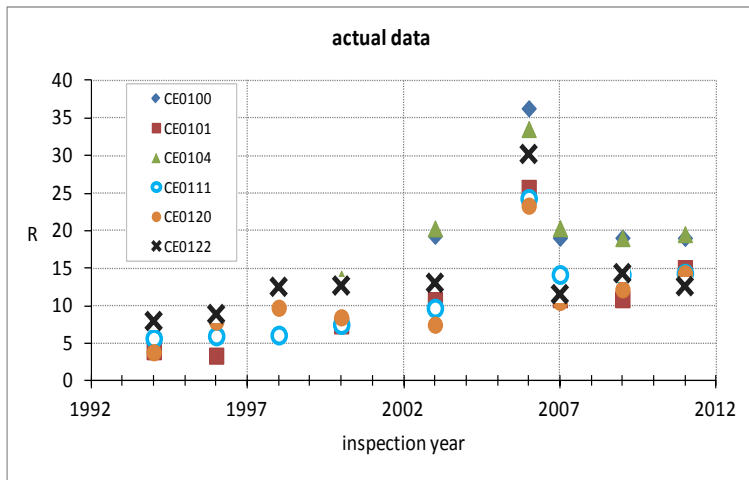

What was analysed?

Condition rating data:

- 1.271 state road bridges
- 18 year time period
- data gathered bi-annually (regular inspections)

Assessment of data quality

$$SE = \sqrt{\frac{1}{(n-2)} \cdot \left[\sum_{t=1}^s (y_t - \bar{y})^2 - \frac{\left[\sum_{t=1}^s (x_t - \bar{x}) \cdot (y_t - \bar{y}) \right]^2}{\sum_{t=1}^s (x_t - \bar{x})^2} \right]}$$

Parameters of influence

PARAMETER OF INFLUENCE	NO. OF VALUES	VALUE
struct. material, M	4	RC (reinforced c.), PC (pre-stressed c.), Sto (stone), Ste (steel)
climate zone, Cl	3	Me (Mediterranean), Co (Continental), Al (Alpine)
traffic load, T	3	L (light), M (medium), H (heavy)
structural type, F	2	B (bridge), P (overpass, underpass)
structural part, Be	3	S_{sub} (substructure), S_{sup} (superstructure), D (deck)

Results

- Traffic load
- Climate type
- Structural material
- Structural type
