Mogila Trstianska
zavzeta od Trstianca 1820. Mon. ovak. Trstianca 1823

La Tertre de Trstianska
commencé le 16 Octobre 1820 et fini le 16 Octobre 1823

Important dates

- 1820 – mounding began
- 1823 – structure completed
- 1850 – fortification began
- 1854 – Fort V finished
- 1939 – entered in the registry of monuments

Geometry

80m – base diameter

8m – diameter of viewing platform

34m – height of the mound

40 – 60° – the angle of slopes

Damage in 1997

Geology

non-cohesive soil (9m)
(sands and gravels)

silts and clays (12-20m)
(with highly plastic areas)

subsoil layer (2-4m)
(silts and clays)

limestone

Reasons for measuring

- continuous degradation
- difficult conditions (material, slopes)
- not fully effective repairs
- lack of full geotechnical documentation until 2012
- surface observations until 2012

Our purposes

- ✓ understand the phenomena occurring over time
- ✓ diagnose the mechanism of ground layers work
- ✓ improve future designs

*It is easier and better to understand phenomena
by experimental way,
than analyse theoretical schemes, which are never
able to accurately reflect phenomena.*

prof. Zbigniew Wasiutyński

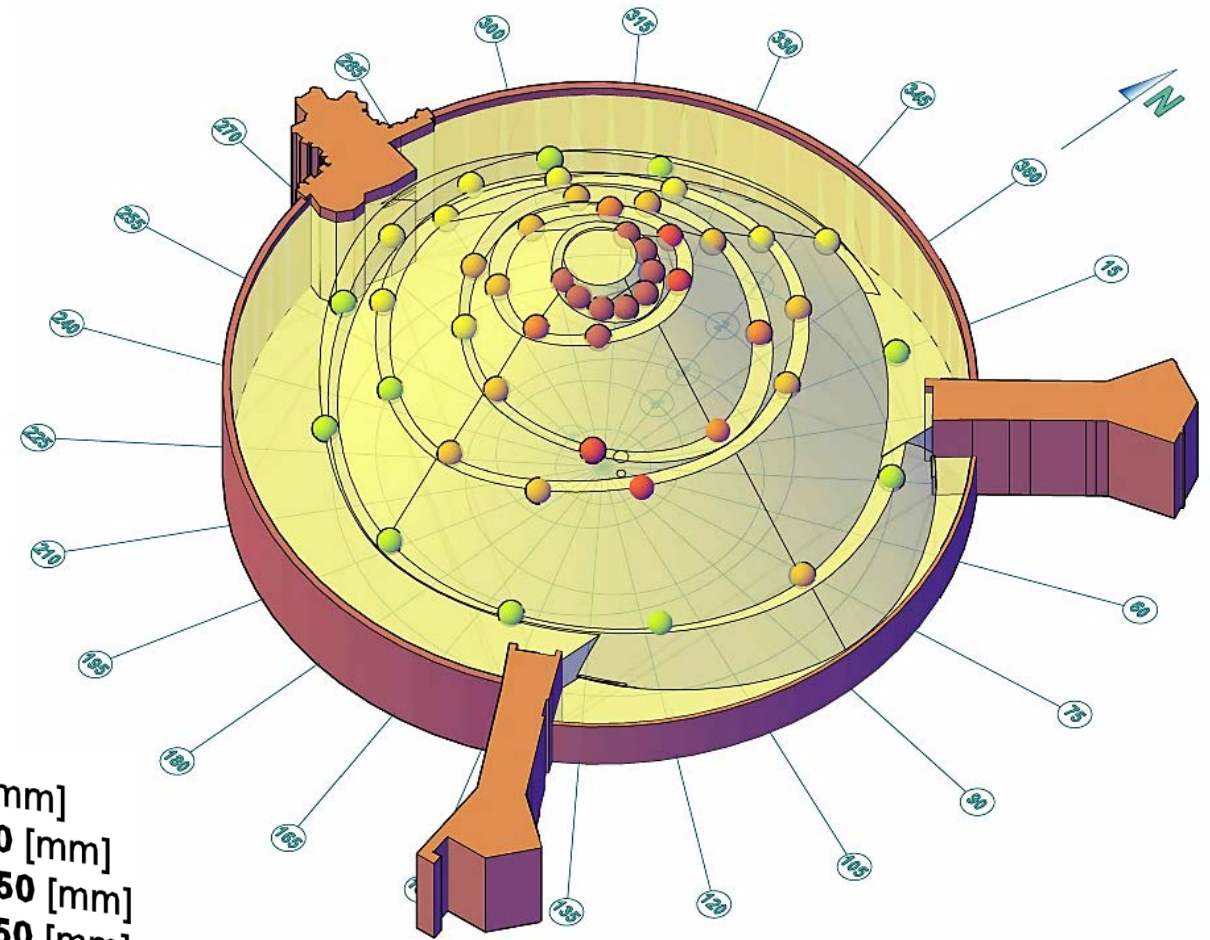

Displacement history

surveying - benchmarks grid

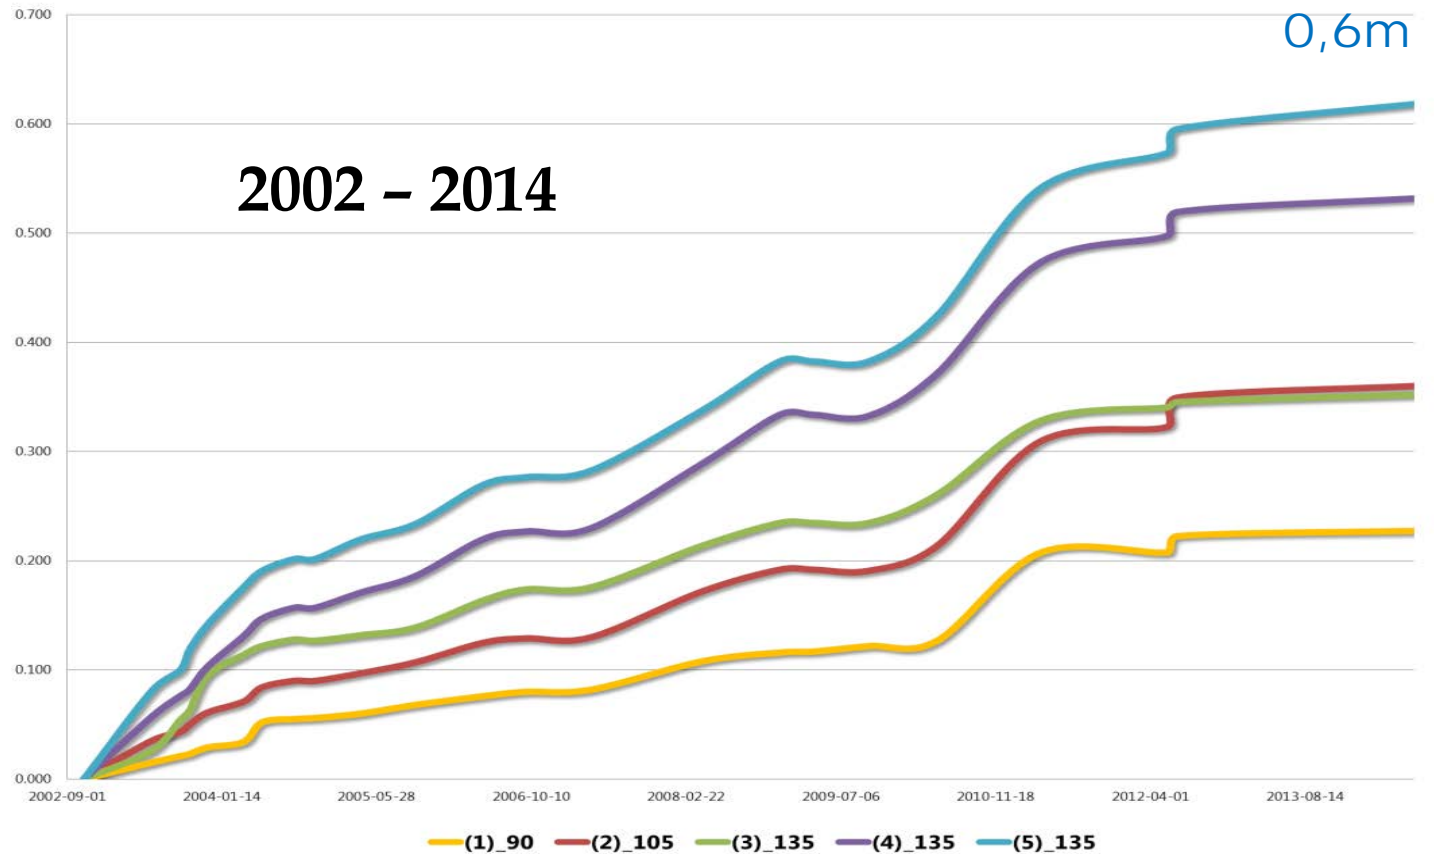

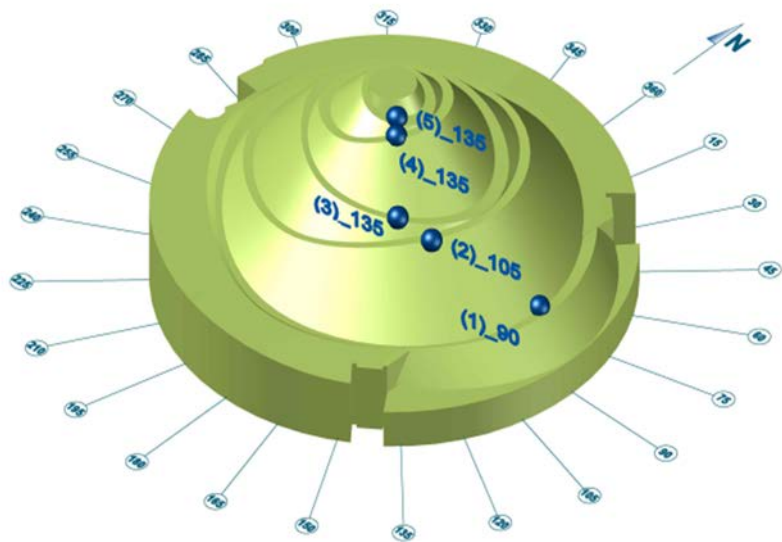

2002 - 2014

- > 500 [mm]
- 350-500 [mm]
- 250 - 350 [mm]
- 150 - 250 [mm]
- 50 - 150 [mm]
- < 50 [mm]

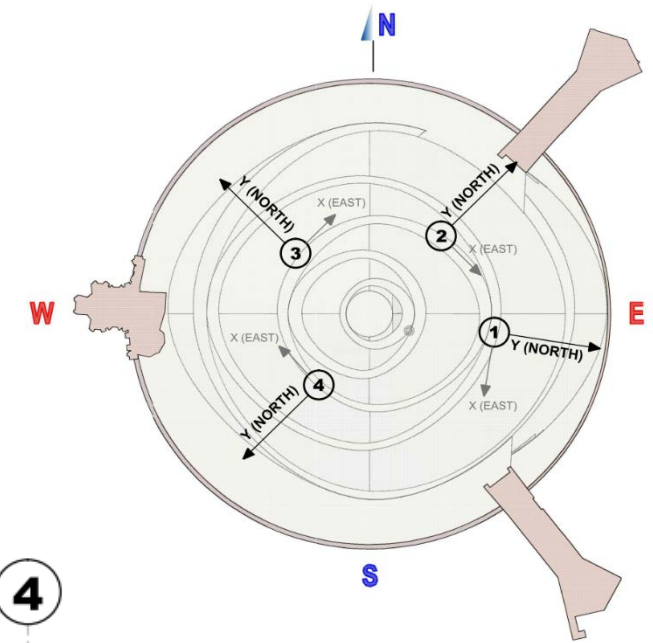

Displacement history

surveys – grid of benchmarks

Previous measurements

Inclinometer measurements

Structural Health Monitoring System (SHM)

A number of sensors connected to datalogger, and used to continuously measure selected physical values, important from the structural point of view.

1. Humidity and temperature

2. Water pressure and temperature

3. Horizontal displacements

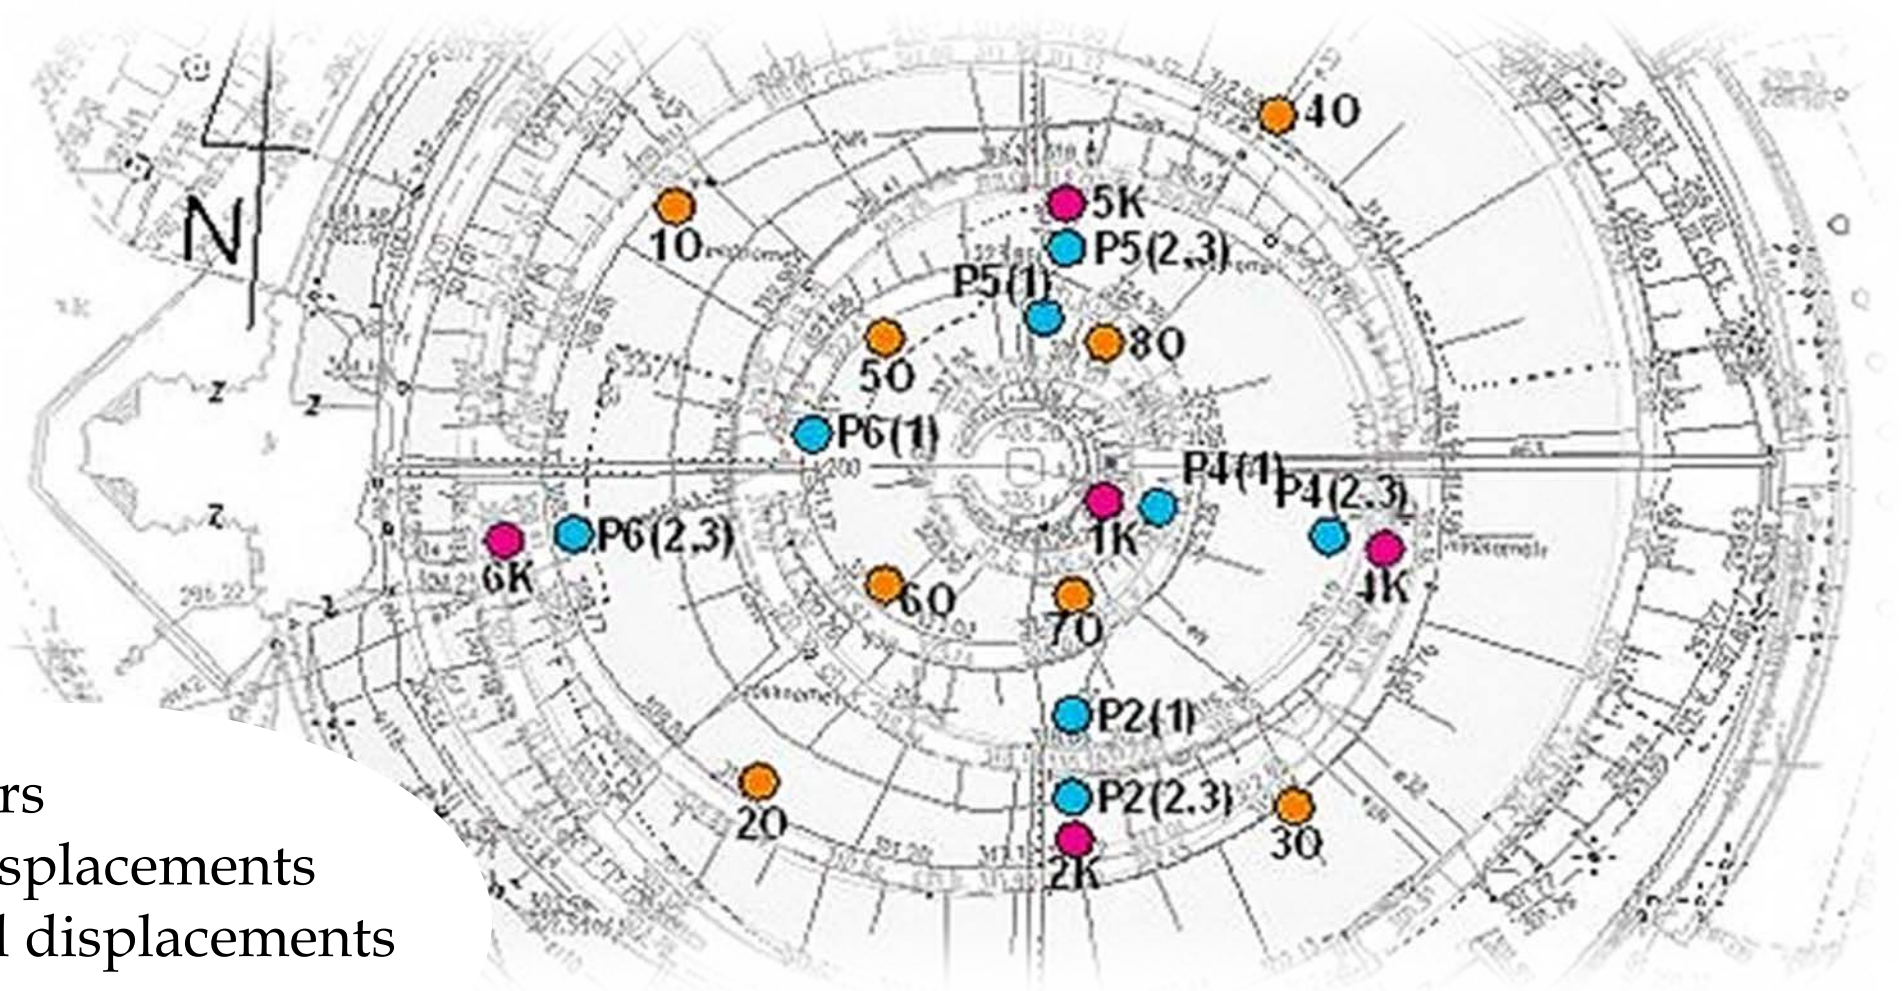

4. Vertical displacements

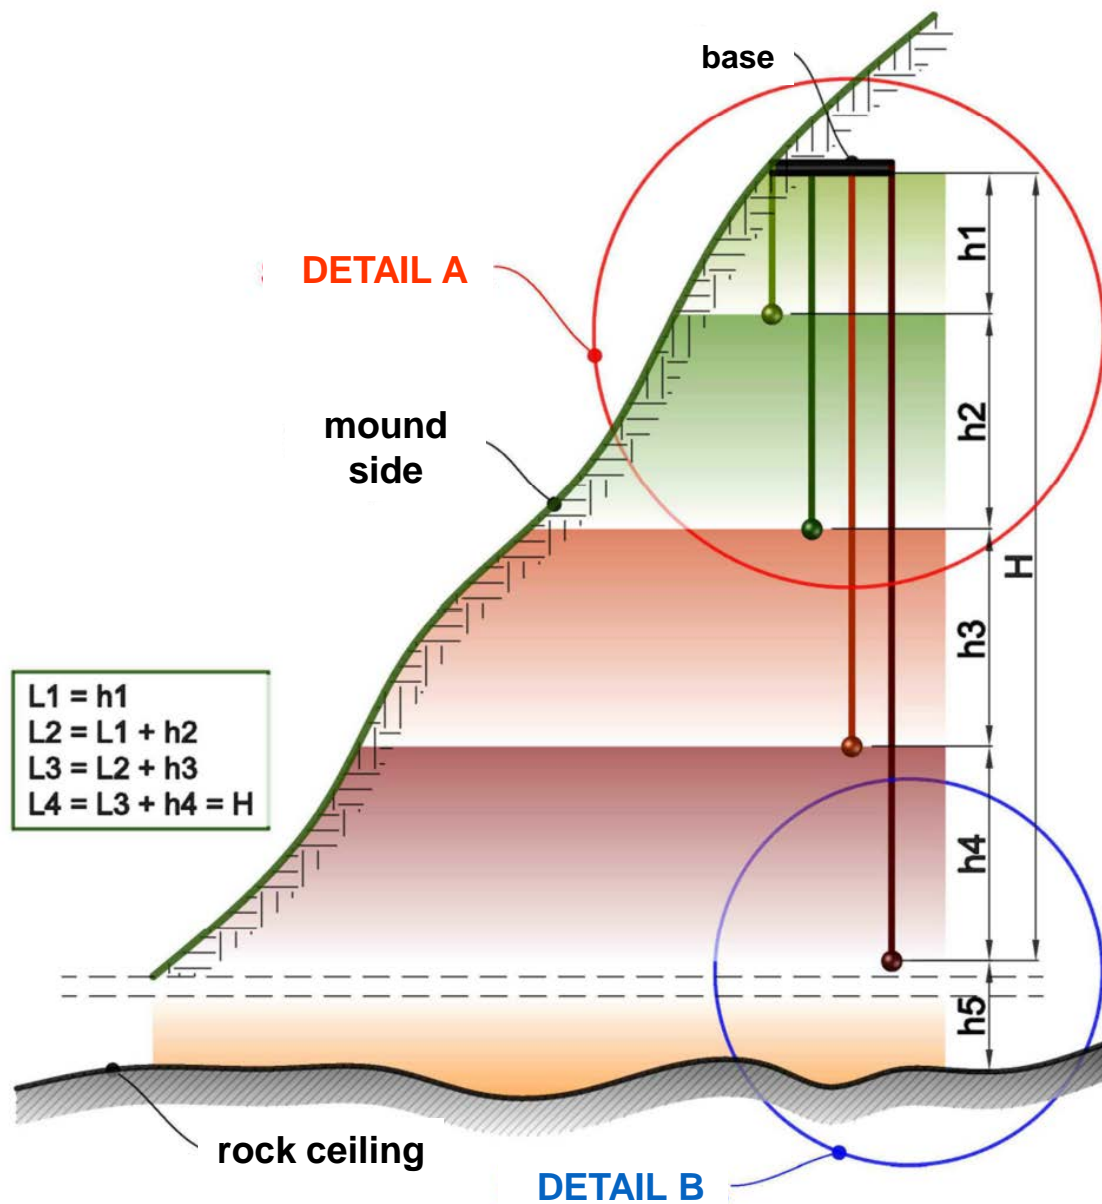

SHM system

- Piezometers
- Vertical displacements
- Horizontal displacements

Vertical displacements

Horizontal displacements

+ temperature

+ humidity

Water pressure in the ground pores

Meteorological monitoring

rain gage

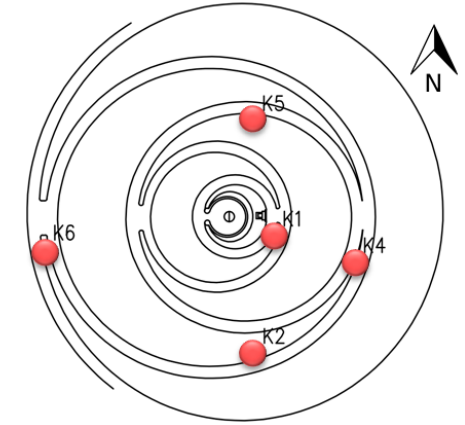

anemometer

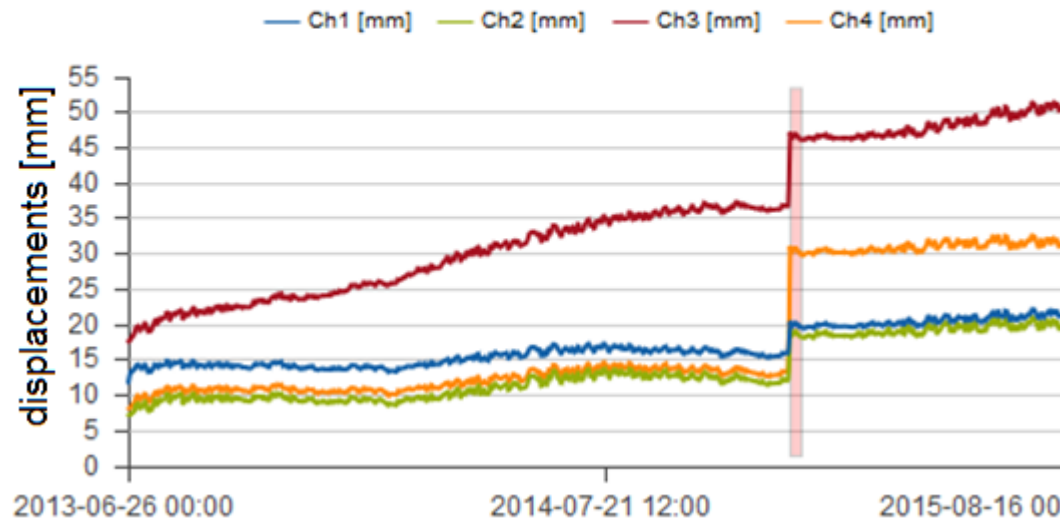

pyranometer

the changes in layer thickness
(sample plots - point 1K)

▲ Point 1K - Vertical displacements

▲ Point 1K - Vertical displacements

Changes in base heights [mm]

point name	Height [m] 26.06.2013	Height [m] 04.03.2014	Height [m] 10.09.2014	difference $\Delta 1$ [mm]	difference $\Delta 2$ [mm]
[1]	[2]	[3]	[4]	[3] - [2]	[4] - [2]
1K	325,483	325,472	325,457	- 11	- 26
2K	311,853	311,853	311,846	0	- 7
4K	314,028	314,024	314,015	- 4	- 13
5K	317,518	317,515	317,505	- 3	- 13
6K	308,066	308,065	308,059	- 1	- 7

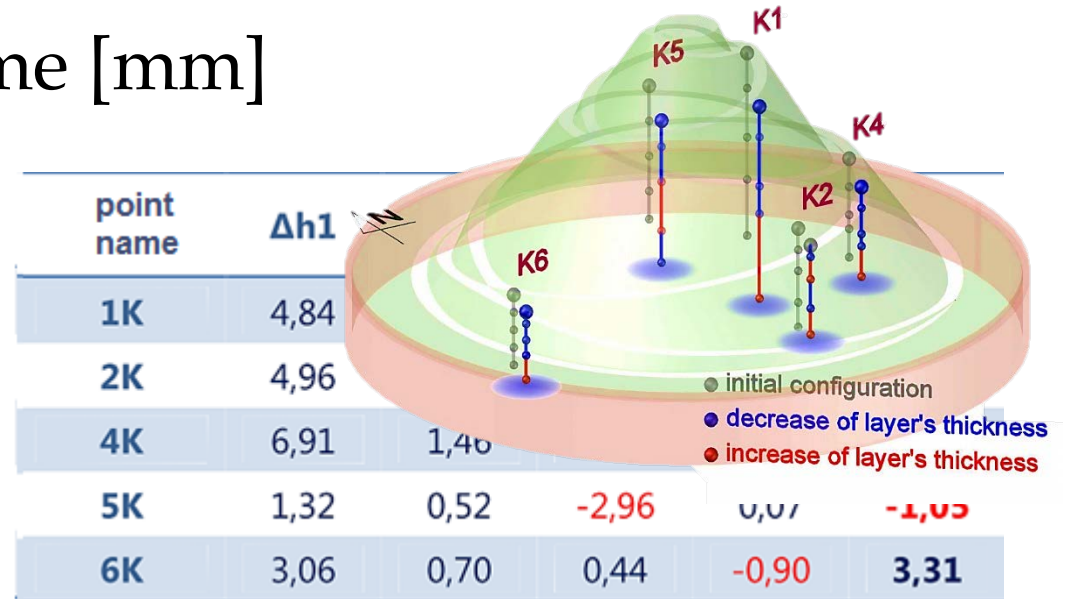

Changes in measurement section lengths [mm]

point name	8 months (26.06.2013 - 04.03.2014)	6 months (04.03.2014 - 10.09.2014)	14 months (26.06.2013 - 10.09.2014)
1K	3,01	2,84	5,85
2K	1,74	2,93	4,67
4K	3,72	4,81	8,53
5K	-0,90	-0,15	-1,05
6K	1,39	1,92	3,31

+ =

Changes in layer thicknesses in time [mm]

point name	Δh_1	Δh_2	Δh_3	Δh_4	$\Sigma = \Delta H$
1K	2,67	-0,32	8,23	-7,56	3,01
2K	2,82	-0,47	0,75	-1,36	1,74
4K	3,68	1,29	-1,05	-0,20	3,72
5K	0,48	0,69	-1,54	-0,53	-0,90
6K	1,48	0,18	0,33	-0,59	1,39

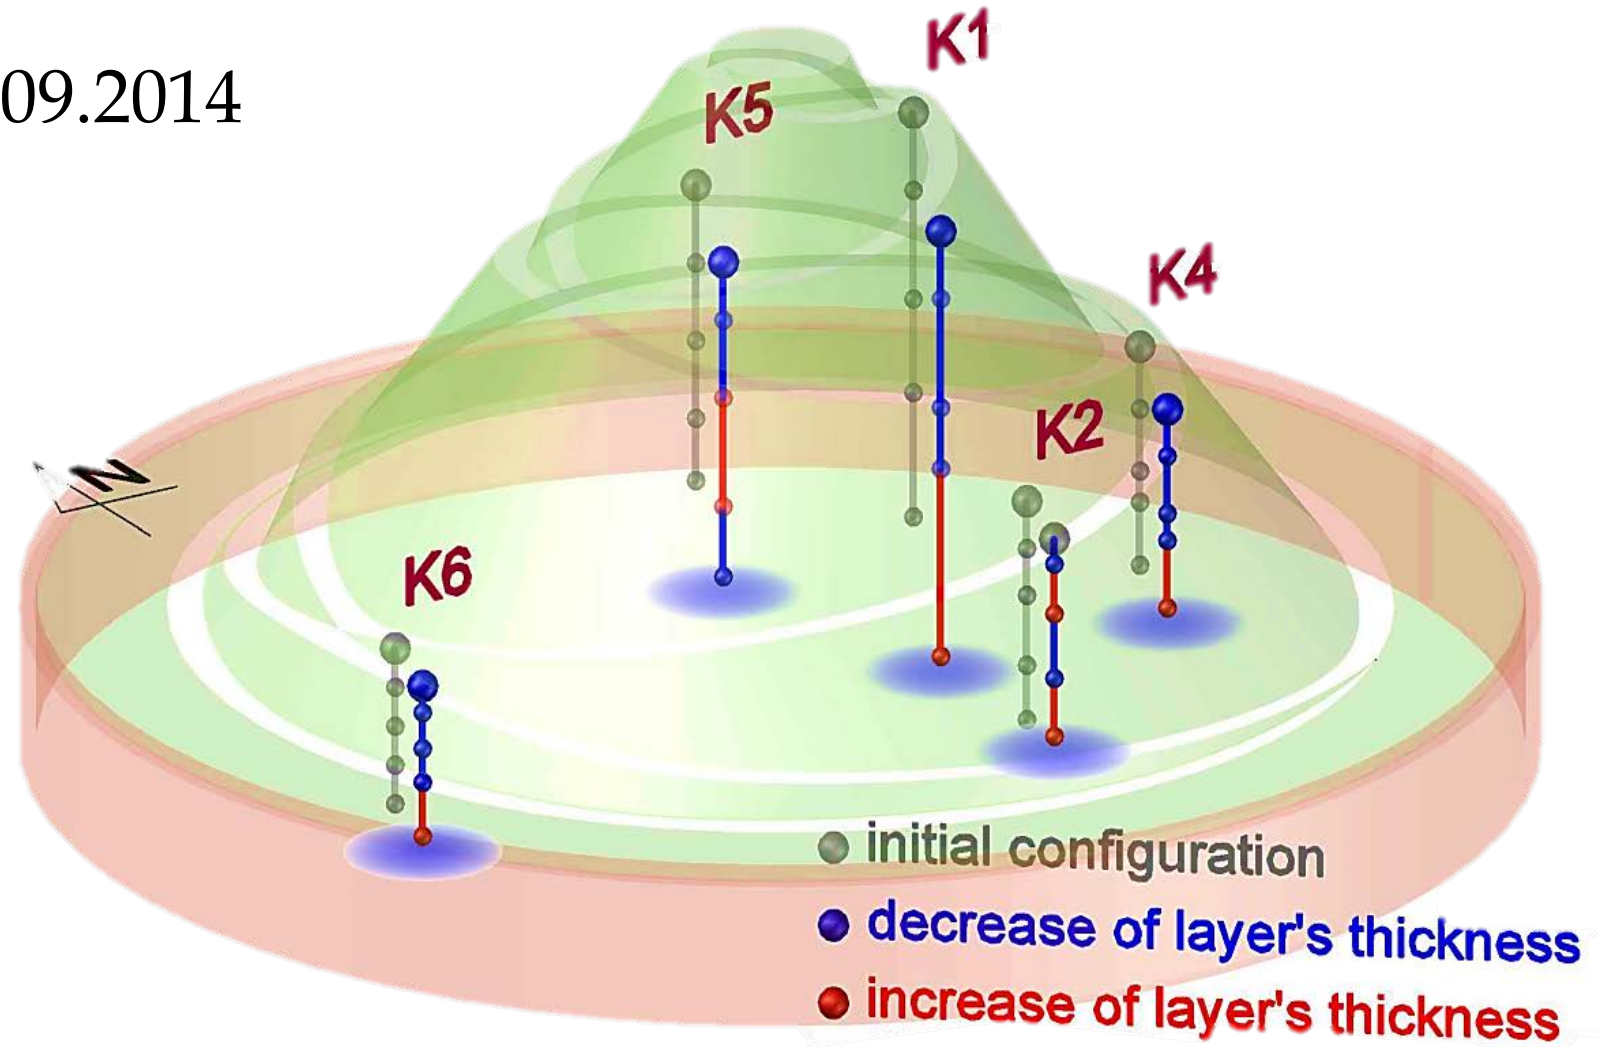

Changes in the lowest layer thickness in time [mm]

point name	ΔH	Δb	$\Delta X = \Delta b - \Delta H$
1K	3,01	11	7,99
2K	1,74	0	-1,74
4K	3,72	4	0,28
5K	-0,90	3	3,90
6K	1,39	1	-0,39

point name	ΔH	Δb	$\Delta X = \Delta b - \Delta H$
1K	5,85	26	20,15
2K	4,67	7	2,33
4K	8,53	13	4,47
5K	-1,05	13	14,05
6K	3,31	7	3,69

26.06.2013 - 10.09.2014

Water pressure in time[kPa] +temperature

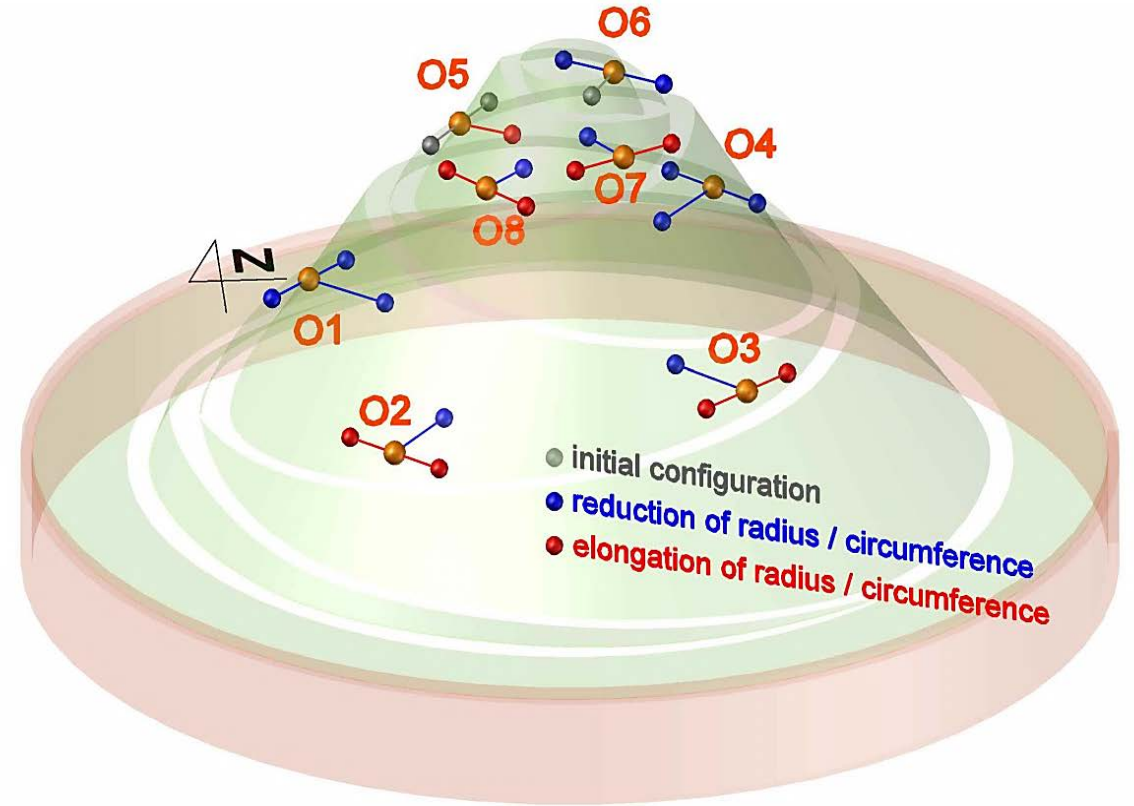

▲ Point 2P - water pressure and temperature

26.06.2013 - 10.09.2014

point name	Ch1	Ch2	Ch3
2P	0,44	6,32	8,25
4p	0,86	8,41	2,80
5p	0,54	19,34	-1,95
6P	11,45	1,65	7,42

Horizontal displacements [mm] + soil temperature

26.06.2013 - 10.09.2014

Point name	O1	O2	O3	O4	O5	O6	O7	O8
Radius	0,84	1,18	0,97	0,93	-0,19	0,47	1,32	1,49
Circumference	-1,24	1,83	1,15	-0,39	-0,14	-0,01	1,31	0,60

Precipitation (rain, snow, fog)

Precipitation measurements: 15.05.2014 - 15.06.2015

Wind (direction and velocity)

Sun radiation

Pyranometric measurements: 15.05.2014 - 31.03.2017

Conclusions

- The rainfall of long duration or high intensity is the greatest danger;
- The deformation begins at the ceiling of limestone and is very irregular in soil layers;
- The mound tilts mostly in the easterly direction;
- Kościuszko Mound is Polish national monument. Basing on experience, comprehensive documentation, detailed analysis, numerical models and in situ measurements (SHM, inclinometers, surveys, weather station) engineering works must be done in order to preserve it from destruction during the incoming centuries.
